Visit Description: US PELVIS

ULTRASOUND PELVIS

HISTORY:

Incidental finding of apparent thickening of endometrial complex in CT thoracic angiogram (TAVI).

FINDINGS:

Transabdominal and transvaginal scans of the pelvis have been performed. The uterus is axial measuring 43 x 36 x 28mm giving a volume of 22.5ml. There is a complex cystic region in the anterior myometrium measuring 11 x 8mm. There is an unremarkable appearance of the cervix. The endometrial canal is distended with fluid. The fluid thickness noted of 12mm. The lining of the endometrial canal itself is thin only measuring up to 3mm DTL. There is no obvious polyp or other focal endometrial lesion. Neither ovary can be demonstrated on either transabdominal or transvaginal scans. There is however no unusual adnexal mass and no free fluid in the pouch of Douglas.

COMMENT:

While the endometrial canal is distended with fluid there is no obvious thickening of the endometrium itself and no obvious focal endometrial lesion. A complex cystic area in the anterior myometrium is noted. There is also no obvious ovarian or adnexal abnormality.
