

Result Type: Progress Note Medical
Result Date: 19 June 2025 9:49 AEST
Result Status: Modified
Result Title: Structural Heart
Performed By: Chan, Bernard (JMO) on 19 June 2025 9:49 AEST
Verified By: Chan, Bernard (JMO) on 19 June 2025 9:49 AEST
Encounter info: Royal North Shore, Inpatient, 09/06/2025 - 20/06/2025

Document Has Been Revised

Structural Heart

Patient: **KNEIPP, Mr John William** MRN: **202-97-41**

Age: **74 years** Sex: **Male** DOB: **07/12/1950**

Associated Diagnoses: **None**

Author: **Chan, Bernard (JMO)**

Progress Note

Structural Heart

Seen by Dr Hansen

74M with severe AS, presenting with shoulder/chest discomfort on dialysis, previous syncope on dialysis

b/g if intellectual disability from RACE, and schizoaffective disorder (escitalopram 10mg daily, olanzapine 15mg nocte). on IHD for ESKD secondary to HTN.

per nursing home - independent with mobilising and most ADLs, minimal assistance with drying after showering, sometimes requires assistance getting dressed.

recommendation from renal team to proceed with aortic valve intervention given foreseeable difficulties with dialysing with progressive AS.

many thanks for assessments from the multiple medical and allied health teams.

patient wanting to go home today

has unfortunately just hit RN (who had informed he needed to fast for angiogram today)

patient would like to go home because it is shopping day today at his nursing home.

minimal other history obtained.

Coronary arteries (from CT TAVI) reviewed by Dr Hansen - codominant system. calcium seen in prox LAD however likely <50% and non-obstructive, some evidence of calcium blooming.

Based on this, his preference would be to perform the coronary angiogram on the same day as the TAVI, which would need to be under general anaesthetic.

Impression

symptomatic severe AS requiring intervention

Plan

Our team to review CT TAVI for TAVI feasibility this morning - if anatomically feasible, then tentative plan to perform combined TAVI + coronary angiogram +/- PCI in the same procedure under GA (as an elective outpatient procedure).

- if not anatomically feasible, then will proceed with coronary angiogram this morning

Given age of 74, should have a cardiac surgical review for AVR (discussed with Dr Lui, CTSx reg w/ thanks)

From a cardiac point of view, can aim DC home later today.

Will update renal once above plan confirmed

Addit 19/06/2025 10:12:53 AEST

CT TAVI reviewed. anatomically feasible. not for angiogram today (or this admission)

Dr Hansen would also like an aged care review - I've contacted orthogeris reg Dr Sanossian - will review this afternoon.

aim DC from cardiac perspective after CTSx and geris reviews
